

The Lightweight IBM Cloud Garage Method for Data Science

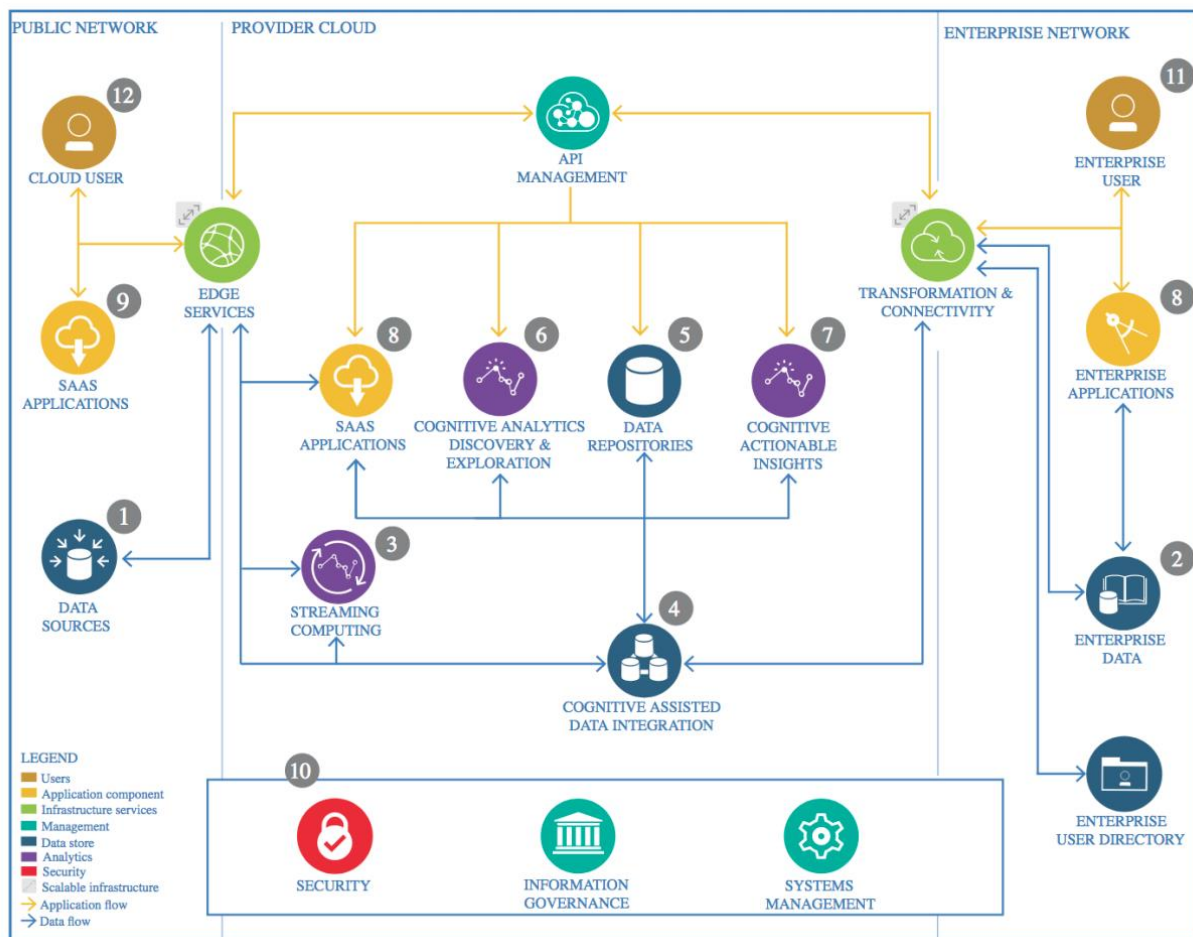

Architectural Decisions Document

Image Classification Project

1. Architectural Components Overview

IBM Data and Analytics Reference Architecture. Source: IBM Corporation

1.1 Data Source

1.1.1 Technology Choice The data was downloaded from Kaggle
<https://www.kaggle.com/puneet6060/intel-image-classification>

1.1.2 Justification

Primary reason to download from Kaggle was availability and ease of use.

1.2 Enterprise Data

1.2.1 Technology Choice

GitHub repository

1.2.2 Justification

Up-to-date data would be available on the repository

1.3 Streaming analytics

1.3.1 Technology Choice

NA

1.3.2 Justification

NA

1.4 Data Integration

1.4.1 Technology Choice

Not used

1.4.2 Justification

Not used

1.5 Data Repository

1.5.1 Technology Choice

Please describe what technology you have defined here. Please justify below, why. In case this component is not needed justify below.

1.5.2 Justification Please justify your technology choices here.

1.6 Discovery and Exploration

1.6.1 Technology Choice

The following Python 3.7 libraries were used for Data Exploration and Visualization:

Matplotlib

1.6.2 Justification

The size of the dataset was the key factor in deciding data exploration tools. The current data is small enough to be processed on a single computer ruling out the need for distributed processing (Spark, pyspark)

1.7 Actionable Insights

1.7.1 Technology Choice

The following Python 3.7 libraries were used for Data Modelling: - OpenCV, Keras, Tensorflow.

1.7.2 Justification

To classify the images a neural network model is required.

The easiest and fastest implementation is in Keras (Tensorflow backend)

1.9 Security, Information Governance and Systems Management

1.9.1 Technology Choice

None

1.9.2 Justification

NA
